**REASONS TO CHOOSE SAAS*****No Hardware or Software***

No hardware or software is required for a SaaS deployment. SaaS is hosted by the provider on their own servers, meaning the client does not need to purchase servers, software, or separate installments.

***Redundancy***

Every Vipa Suite website is hosted on multiple servers at a time and backed up on several other locations. If a server crashes, the website does not go down.

***Security***

SaaS requires log in information with numerous security features based on permissions. This gives you the peace of mind that experts are managing your valuable data.

***PCI Compliance***

Payment Card Industry Compliance is achieved by the SaaS provider. This ensures security on the site if money is being transacted. PCI Compliance is automatically implemented without it being a burden to the agency or client.

***Costs - ROI***

Using SaaS cuts costs in many areas such as: development, hosting, maintenance, staffing requirements, hardware and software needs. Including the set up fee and monthly ongoing fees, SaaS is the option with the greatest ROI.

***Speed of Technology***

Because technology moves at such a fast pace, it is challenging to keep up with the research and development process. With SaaS, the provider takes care of the R&D. You have access to the latest product enhancements without spending the time or money on development.

***Upgrades***

With the SaaS provider taking care of the R&D, clients have the latest upgrades without having to take the time to update servers or install software upgrades. Because the SaaS provider manages all of the upgrades, all clients get access to the latest software updates as soon as they are made available.

***Centralized***

Centralization of SaaS allows users to log in from anywhere with internet access.
